		Replace the cap after use.

There are many different types of metered dose inhalers. Your inhaler has been prescribed for you **only** and to treat your specific lung condition.

How to look after your aerochamber spacer

- Wash your spacer once every month and it should be replaced after one year.
- Remove the rubber end from the spacer.
- Prepare a bowl of room temperature water with some detergent.
 Place both rubber end and spacer in the bowl of water.
- Leave to soak for 10 minutes. Rinse well with water.
 Leave to drip dry overnight.
- Do not use any towels, tissues, sponges or anything abrasive to clean or dry your spacer device.
- Do not rub the inside with a cloth or polish as this causes static build up which can affect how the device works.
- Aerochamber spacers are not suitable for dishwashers.
- You can clean the mouthpiece with a moist tissue after each use if needed.

Why should I use a spacer device with my metered dose inhaler?

Did you know that even with perfect inhaler technique up to 80% of a dose can be wasted?

Using a spacer device means:

- You can double the amount of drug from your inhaler getting into your lungs.
- It is easier to get the right dose of medicine.
- You may need to use less medicine.
- Spacers help prevent the medicine from sticking to the back of your throat. They help reduce the risk of side effects (such as sore throat, voice hoarseness or oral thrush if using steroid containing inhalers).
